Scope of Work (SOW)

Ecommerce Guru — Listing & Support Enhancements

Field	Detail
Document version	1.0
Date	26 October 2026
Product	Ecommerce Guru (Listing Analyzer Pro)
Status	Draft for client / stakeholder approval
Deployment target (app)	`staging` branch → production when approved

---

1. Purpose

This Scope of Work describes **what will be delivered**, **how work will be done**, **dependencies**, and **what is out of scope** for two related efforts:

1. **Platform enhancements** — seven client-requested listing and AI capabilities on the existing Build Your Brand / Products workflow.
2. **Support inbox (Chatwoot)** — WhatsApp voice messages appearing as download-only cards instead of inline audio playback.

No development starts until this SOW (or selected phases) is **approved in writing**.

---

2. Background — current state

2.1 Ecommerce Guru (in codebase today)

Area	Current capability
Listing Excel export	Amazon flat-file style (~25 columns); bulk export up to 100 products
Categories	UI picker (~100+ browse-style names); `feed_product_type` empty in export
AI content	One marketplace per project; one `generated_content` per audit
Bulk operations	Bulk **Excel export** only — not bulk AI generation
Multi-marketplace copy	Single primary copy; `product_profiles.target_marketplaces` is metadata only
Revenue	Historical order revenue on product detail — **no** Amazon fee / margin calculator
A+ graphics	Workflow + admin prompt templates; images in `audits.generated_images.aplus`
AI policy	Amazon rules in `content_marketplaces` / seeded instructions — no uploaded policy docs

In-app support tickets	Text-only tickets in admin — **separate** from Chatwoot

2.2 Chatwoot (external — not in app repo)

WhatsApp voice notes arrive as media attachments. Inbox may show **"Voice message" / `[VOICE]`** with **download only**, depending on Chatwoot version, file type (OGG vs MP3), and server configuration.

---

3. Objectives

#	Objective
O1	Richer Amazon Excel and structured listing attributes without breaking existing exports
O2	Expanded, marketplace-aligned product types / categories (incl. Amazon India context)
O3	Bulk AI listing content generation for many products with credit and job tracking
O4	Simultaneous multi-marketplace content generation and export
O5	Revenue / fee / profitability calculator (Amazon India fees as reference)
O6	A+ Content graphics aligned with client reference modules and templates
O7	AI content constrained by client / marketplace policy documents
O8	Chatwoot agents can **play** WhatsApp voice notes in-browser where possible

---

4. Workstreams

Workstream A — Ecommerce Guru platform (this repository)

Delivered via phased releases on **`staging`**, validated, then promoted to production per your release process (`bash deploy.sh staging` on server).

Workstream B — Chatwoot & WhatsApp (Chatwoot server / infrastructure)

Delivered on the **Chatwoot host** (Docker/VM): upgrade, ffmpeg, channel and storage fixes. **Does not** require changes to Listing Analyzer Pro unless you later embed Chatwoot in the site.

---

5. Detailed scope — Workstream A (platform)

Phase A1 — Listing attributes, categories, policy foundation

Goal: Match client reference Excel structure (columns TBD from reference file) and improve category / product type accuracy.

Deliverable	Description
Product type catalog	Admin-maintained or seeded `amazon_product_types` (marketplace, feed type, display name)

Attribute templates	`amazon_listing_attribute_templates` driving UI fields and Excel columns
Audit fields	Additive columns on `audits`: `listing_attributes` (jsonb), `feed_product_type`, optional category metadata
Excel export v2	Existing columns preserved; new columns or "Attributes" sheet; empty data = same behavior as today
Category UI	Structured picker linked to product types; keep legacy text `category` for old projects
Policy documents (v1)	`marketplace_policy_documents` + admin upload/paste; inject into AI prompts for Amazon/default marketplace

Acceptance criteria

- Exporting an **old** project without new fields produces the **same** core columns as today.
- New projects can fill attributes and see them in downloaded Excel.
- AI generation includes policy excerpt when a document is active for that marketplace.
- Reference Excel column list signed off against client file.

Database (additive)

- Modify: `audits`, `product_profiles` (optional), `content_marketplaces` (optional policy FK/text)
- New: `amazon_product_types`, `amazon_listing_attribute_templates`, `marketplace_policy_documents`

Phase A2 — Multi-marketplace content

Goal: Generate and store copy for multiple marketplaces in one action; export per client reference sheet layout.

Deliverable	Description
Variant storage	`audit_content_variants` (audit + marketplace + `generated_content`)
Primary copy	`audits.generated_content` remains default for preview and backward compatibility
UI	Multi-select marketplaces on content step; progress and errors per marketplace
Export	Multi-sheet or multi-row Excel per reference; reuse bulk export patterns where possible
Credits	Charge per marketplace generation (same rules as today, summed)

Acceptance criteria

- Single-marketplace projects behave as today.
- User can generate Amazon + eBay + Shopify (scope list TBD) in one run.
- Excel download includes each selected marketplace.

Database

- New: `audit_content_variants`

- Optional seed: `content_marketplaces` row e.g. `amazon-in`

Phase A3 — Bulk content generation

Goal: From Products list, select many audits and queue AI content generation (not only bulk Excel export).

Deliverable	Description
Job API	Create job, list status, per-item success/failure
UI	“Bulk generate content” with cap (e.g. 100, aligned with bulk export)
Notifications	Optional email/in-app when job completes
Credits	Preflight total credits; deduct per successful item

Acceptance criteria

- Existing single-audit generate unchanged.
- Failed items reported with reason; successful items update `generated_content`.

Database

- New: `content_generation_jobs`, `content_generation_job_items`

Phase A4 — Revenue calculator

Goal: Estimate selling price, fees, COGS, margin using Amazon India fee structure as baseline (extendable).

Deliverable	Description
Fee rules data	`marketplace_fee_rules` seeded from public fee tables (IN first; scope TBD)
Calculator UI	Standalone page or product panel: price, cost, weight/category → fee breakdown, net margin
Optional save	`product_profit_scenarios` linked to audit

Acceptance criteria

- Calculator works offline from seeded rules (no SP-API required for v1).
- Disclaimers: estimates only, not tax/legal advice.

Database

- New: `marketplace_fee_rules`, optional `product_profit_scenarios`

Phase A5 — A+ Content graphics (content & templates)

Goal: Align modules and prompts with client A+ reference document.

Deliverable	Description
Template updates	New/updated rows in `image_prompt_templates` (category `aplus`)

Module list	Extend or configure A+ module cards to match reference
Docs	Short admin guide for regenerating modules

Acceptance criteria

- Existing A+ projects still load.
- New generations follow client module/layout reference.

Database

- Data changes primarily; optional metadata in `image_prompt_templates`
- `audits.generated_images.aplus` json extended only additively

---

6. Detailed scope — Workstream B (Chatwoot voice messages)

Goal: Agents hear WhatsApp voice notes in the dashboard without mandatory download.

Step	Activity
B1	Document current Chatwoot version, install method (Docker compose / K8s / cloud)
B2	Upgrade Chatwoot to supported release with HTML5 audio for attachments
B3	Install **ffmpeg** in Rails/worker container if transcoding OGG→MP3 is required
B4	Verify WhatsApp channel (Meta Cloud / Evolution / Twilio): media download enabled
B5	Test inbound voice: attachment `file_type` = audio; play in Chrome/Edge
B6	Fix Active Storage / shared volume if 404-on-first-load (rails + sidekiq same storage)

Acceptance criteria

- New WhatsApp voice note shows **play control** (or reliable play after single load).
- Conversation list preview remains `[VOICE]` or improved label (channel-dependent).

Out of scope for Workstream B

- Rewriting Chatwoot in Ecommerce Guru
- Automatic speech-to-text transcription (optional future phase)

---

7. Technical principles (Workstream A)

1. **Additive schema only** — no removal of `generated_content`, existing export headers, or single-generate APIs.
2. **Staging first** — merge to `staging`, deploy with `bash deploy.sh staging`, UAT, then production.
3. **Credits & permissions** — reuse workspace roles and existing credit preflight patterns.
4. **Reference files** — client Excel, policy PDFs, and A+ doc required before A1/A5 sign-off on column/module parity.

---

8. Dependencies & inputs required from client

Input	Used in
Reference Excel (listing attributes)	A1 export columns
Multi-marketplace reference Excel	A2 export layout
Amazon listing policy document(s)	A1 / A7 prompts
A+ Content reference doc	A5 templates
Marketplace list for multi-generate	A2
Revenue calculator scope (IN only vs all export marketplaces)	A4
Chatwoot server access (SSH/env)	B1–B6
WhatsApp Business / API credentials (read-only for testing)	B4–B5

---

9. Out of scope (unless added by change order)

- Replacing Chatwoot with native in-app WhatsApp chat
- Voice-to-text transcription of customer voice notes in Chatwoot
- Automatic listing publish to Amazon SP-API for new attribute columns (export-only unless separately scoped)
- Changes to `main` /production deploy without explicit approval
- Clerk/native auth, SMTP, or unrelated dashboard UI (e.g. search placeholder) unless bundled in change order

---

10. Testing & acceptance

Workstream	Testing
A	`pnpm run typecheck`; per-package build; manual UAT on staging: workflow, export, bulk job, calculator
B	Send test WhatsApp voice to staging inbox; verify play in agent dashboard

Sign-off: named approver confirms each **phase** complete before next phase starts (recommended).

---

11. Deployment

Component	Method
Ecommerce Guru	Git `staging` → server `/root/Listing-Analyzer-Pro` → `bash deploy.sh staging`
Database	`scripts/sync-local-db.sh` (dev); `scripts/sync-production-db.sh` (prod) after schema migrations
Chatwoot	Separate deploy process on Chatwoot host; backup before upgrade

---

12. Recommended phase order & approval gates

Order	Phase	Workstream	Gate
1	A1	Platform	Approve columns + policy v1
2	A5 or parallel	Platform	Approve A+ reference mapping
3	A2	Platform	Approve marketplace list
4	A3	Platform	Approve bulk limits & credits
5	A4	Platform	Approve fee scope (IN vs global)
Parallel	B1–B6	Chatwoot	Approve server access + upgrade window

---

13. Deliverables summary

#	Deliverable	Format
D1	Working features on staging URL	Deployed app
D2	Schema migration scripts	Repo + sync scripts
D3	Admin configuration guide (types, policy, fees)	Markdown in repo / PDF
D4	Database impact reference	`docs/client-features-database-impact.*`
D5	Chatwoot voice fix runbook	Section 6 + optional ops doc
D6	This Scope of Work	PDF / DOCX / Markdown

---

14. Approval

Role	Name	Signature	Date
Client / Product owner			
Technical lead			

Approved phases (check all that apply):

- ☐ A1 — Attributes, categories, policy v1
- ☐ A2 — Multi-marketplace content
- ☐ A3 — Bulk content generation
- ☐ A4 — Revenue calculator
- ☐ A5 — A+ templates
- ☐ B — Chatwoot voice playback

End of Scope of Work
